

# Package 'lazytrade'

January 19, 2021

**Type** Package

**Title** Learn Computer and Data Science using Algorithmic Trading

**Version** 0.4.4

**Author** Vladimir Zhbanko

**Maintainer** Vladimir Zhbanko <vladimir.zhbanko@gmail.com>

**Description** Provide sets of functions and methods to learn and practice data science using idea of algorithmic trading.

Main goal is to process information within "Decision Support System" to come up with analysis or predictions.

There are several utilities such as dynamic and adaptive risk management using reinforcement learning

and even functions to generate predictions of price changes using pattern recognition deep regression learning.

Summary of Methods used: Awesome H2O tutorials: <<https://github.com/h2oai/awesome-h2o>>,

Market Type research of Van Tharp Institute: <<https://www.vantharp.com/>>,

Reinforcement Learning R package: <<https://CRAN.R-project.org/package=ReinforcementLearning>>.

**License** MIT + file LICENSE

**URL** [https://vladdsm.github.io/myblog\\_attempt/topics/lazy%20trading/](https://vladdsm.github.io/myblog_attempt/topics/lazy%20trading/),  
<https://github.com/vzhomeexperiments/lazytrade>

**BugReports** <https://github.com/vzhomeexperiments/lazytrade/issues>

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.1

**Imports** readr, stringr, dplyr, lubridate, ggplot2, grDevices, h2o,  
ReinforcementLearning, openssl, stats, cluster

**Suggests** testthat (>= 2.1.0), covr, magrittr, data.table, bit64

**Depends** R (>= 3.4.0)

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2021-01-19 22:30:02 UTC

**R topics documented:**

---

aml_collect_data	<i>Function to read new data, transform, aggregate and save data for further retraining of regression model for a single currency pair</i>
------------------	--------------------------------------------------------------------------------------------------------------------------------------------

---

## Description

Function is collecting data from the csv files Data objects are transformed to be suitable for Regression Modelling. Price change will be in the column 'LABEL', column X1 will keep the time index Result will be written to a new or aggregated to the existing '.rds' file

Function is keeping generated dataset to be not larger than specified by the user

## Usage

```
aml_collect_data(
  indicator_dataset,
  symbol,
  timeframe,
  path_data,
  max_nrows = 2500
)
```

## Arguments

indicator_dataset	Dataset containing assets indicator which pattern will be used as predictor
symbol	Character symbol of the asset for which to train the model
timeframe	Data timeframe e.g. 1 min
path_data	Path where the aggregated historical data is stored, if exists in rds format
max_nrows	Integer, Maximum number of rows to collect

**Details**

Function is not handling shift of the price and indicator datasets.

This function is relying on the data collection from the dedicated data robot Other 'aml\_\*' functions will work based on the data processed by this function

**Value**

Function is writing files into Decision Support System folder, mainly file object with the model

**Author(s)**

(C) 2020 Vladimir Zhabanko

**Examples**

```
# write examples for the function
library(dplyr)
library(readr)
library(lubridate)
library(lazytrade)
library(magrittr)

# sample dataset
ind = system.file("extdata", "AI_RSIADXUSDJPY60.csv",
                 package = "lazytrade") %>% read_csv(col_names = FALSE)

# convert to POSIX format
ind$X1 <- ymd_hms(ind$X1)

# create temporary path (check output of tempdir() to check the result)
path_data <- normalizePath(tempdir(), winslash = "/")

# data transformation using the custom function for one symbol
aml_collect_data(indicator_dataset = ind,
                 symbol = 'USDJPY',
                 timeframe = 60,
                 path_data = path_data)
```

## Description

Function is training h2o deep learning model to match future prices of the asset to the indicator pattern. Main idea is to be able to predict future prices by solely relying on the recently retrieved indicator pattern. This is to mimic traditional algorithmic systems based on the indicator rule attempting to automate optimization process with AI.

Deep learning model structure is obtained from the 8 random combinations of neurons within 3 hidden layers of the network, the most accurate model configuration will be automatically selected

In addition, the function will check if there is a need to update the model. To do that function will check results of the function aml\_test\_model.R.

## Usage

```
aml_make_model(  
  symbol,  
  timeframe,  
  path_model,  
  path_data,  
  force_update = FALSE,  
  num_nn_options = 24,  
  min_perf = 0.3  
)
```

## Arguments

symbol	Character symbol of the asset for which to train the model
timeframe	Data timeframe e.g. 1 min
path_model	Path where the models shall be stored
path_data	Path where the aggregated historical data is stored, if exists in rds format
force_update	Boolean, by setting this to TRUE function will generate new model (useful after h2o engine update)
num_nn_options	Integer, value from 1 to 20 or more. Used to change number of variants of the random neural network structures
min_perf	Double, value greater than 0. Used to set minimum value of model performance. Higher value will increase computation time

## Details

Function is using the dataset prepared by the function aml\_collect\_data.R. Function will start to train the model as soon as there are more than 1000 rows in the dataset

## Value

Function is writing a file object with the best Deep Learning Regression model

## Author(s)

(C) 2020 Vladimir Zhbanko

**Examples**

```
library(dplyr)
library(readr)
library(h2o)
library(lazytrade)
library(lubridate)
library(magrittr)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

ind = system.file("extdata", "AI_RSIADXUSDJPY60.csv",
                  package = "lazytrade") %>% read_csv(col_names = FALSE)

ind$X1 <- ymd_hms(ind$X1)

# data transformation using the custom function for one symbol
aml_collect_data(indicator_dataset = ind,
                 symbol = 'USDJPY',
                 timeframe = 60,
                 path_data = path_data)

# dataset will be written to the temp directory

# start h2o engine
h2o.init(nthreads = 2)

# performing Deep Learning Regression using the custom function
aml_make_model(symbol = 'USDJPY',
               timeframe = 60,
               path_model = path_model,
               path_data = path_data,
               force_update=FALSE,
               num_nn_options = 3,
               min_perf = 0)

# stop h2o engine
h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)
```

---

aml_score_data	<i>Function to score new data and predict change for each single currency pair</i>
----------------	------------------------------------------------------------------------------------

---

### Description

Function is using the latest data from the financial assets indicator pattern and deep learning model. Prediction is a price change in the future for that asset will be used by the trading system

### Usage

```
aml_score_data(symbol, timeframe, path_model, path_data, path_sbxm, path_sbxs)
```

### Arguments

symbol	Character symbol of the asset for which the model shall predict
timeframe	Data timeframe e.g. 60 min
path_model	Path where the models are be stored
path_data	Path where the aggregated historical data is stored, if exists in rds format
path_sbxm	Path to the sandbox where file with predicted price should be written (master terminal)
path_sbxs	Path to the sandbox where file with predicted price should be written (slave terminal)

### Details

Performs fresh data reading from the rds file

### Value

Function is writing file into Decision Support System folder, mainly file with price change prediction in pips

### Author(s)

(C) 2020 Vladimir Zhbanko

### Examples

```
# test of function aml_make_model is duplicated here
library(dplyr)
library(readr)
library(lubridate)
library(h2o)
```

```
library(magrittr)
library(lazytrade)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

ind = system.file("extdata", "AI_RSIADXUSDJPY60.csv",
                  package = "lazytrade") %>% read_csv(col_names = FALSE)

ind$X1 <- ymd_hms(ind$X1)

write_csv(ind, file.path(path_data, "AI_RSIADXUSDJPY60.csv"), col_names = FALSE)

# data transformation using the custom function for one symbol
aml_collect_data(indicator_dataset = ind,
                 symbol = 'USDJPY',
                 timeframe = 60,
                 path_data = path_data)
# start h2o engine (using all CPU's by default)

h2o.init(nthreads = 2)

# performing Deep Learning Regression using the custom function
aml_make_model(symbol = 'USDJPY',
               timeframe = 60,
               path_model = path_model,
               path_data = path_data,
               force_update=FALSE,
               num_nn_options = 2)

path_sbxm <- normalizePath(tempdir(),winslash = "/")
path_sbxs <- normalizePath(tempdir(),winslash = "/")

# score the latest data to generate predictions for one currency pair
aml_score_data(symbol = 'USDJPY',
               timeframe = 60,
               path_model = path_model,
               path_data = path_data,
               path_sbxm = path_sbxm,
               path_sbxs = path_sbxs)

# stop h2o engine
h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)
```

---

aml_test_model	<i>Function to test the model and conditionally decide to update existing model for a single currency pair</i>
----------------	----------------------------------------------------------------------------------------------------------------

---

### Description

Function is designed to test the trading decision generated by the Deep learning regression model. It is doing so by simulating trading strategy outcome. The outcome of this function will be also used to define best trigger to join into the tradin opportunity

### Usage

```
aml_test_model(
  symbol,
  numBars,
  timeframe,
  path_model,
  path_data,
  path_sbxm = path_sbxm,
  path_sbxs = path_sbxs
)
```

### Arguments

symbol	Character symbol of the asset for which to train the model
numBars	Integer, Number of (rows) bars used to test the model
timeframe	Integer, Data timeframe e.g. 60 min. This will be equal to 1 bar
path_model	String, User path where the models are be stored
path_data	String, User path where the aggregated historical data is stored, if exists in rds format
path_sbxm	String, User path to the sandbox where file with strategy test results should be written (master terminal)
path_sbxs	String, User path to the sandbox where file with strategy test results should be written (slave terminal)

### Details

Function is reading price data and corresponding indicator. Starting from the trained model function will test the trading strategy using simplified trading approach. Trading approach will entail using the last available indicator data, predict the price change for every row, trade will be simulating by holding the asset for 3, 5, 10 and 34 hours. Several trigger points will be evaluated selecting the most optimal trading trigger. Function is writing most optimal decision into \*.csv file Such file will be used by the function aml\_make\_model.R to decide whether model must be updated...

**Value**

Function is writing file into Decision Support System folders

**Author(s)**

(C) 2020 Vladimir Zhibanko

**Examples**

```
library(dplyr)
library(magrittr)
library(readr)
library(h2o)
library(lazytrade)
library(lubridate)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

ind = system.file("extdata", "AI_RSIADXUSDJPY60.csv",
                  package = "lazytrade") %>% read_csv(col_names = FALSE)

ind$X1 <- ymd_hms(ind$X1)

tick = system.file("extdata", "TickSize_AI_RSIADX.csv",
                  package = "lazytrade") %>% read_csv(col_names = FALSE)

write_csv(ind, file.path(path_data, "AI_RSIADXUSDJPY60.csv"), col_names = FALSE)

write_csv(tick, file.path(path_data, "TickSize_AI_RSIADX.csv"), col_names = FALSE)

# data transformation using the custom function for one symbol
aml_collect_data(indicator_dataset = ind,
                 symbol = 'USDJPY',
                 timeframe = 60,
                 path_data = path_data)

# start h2o engine
h2o.init(nthreads = 2)

# performing Deep Learning Regression using the custom function
aml_make_model(symbol = 'USDJPY',
               timeframe = 60,
               path_model = path_model,
               path_data = path_data,
               force_update=FALSE,
               num_nn_options = 3)
```

```
path_sbxm <- normalizePath(tempdir(),winslash = "/")
path_sbxs <- normalizePath(tempdir(),winslash = "/")

# score the latest data to generate predictions for one currency pair
aml_score_data(symbol = 'USDJPY',
               timeframe = 60,
               path_model = path_model,
               path_data = path_data,
               path_sbxm = path_sbxm,
               path_sbxs = path_sbxs)

# test the results of predictions
aml_test_model(symbol = 'USDJPY',
               num_bars = 600,
               timeframe = 60,
               path_model = path_model,
               path_data = path_data,
               path_sbxm = path_sbxm,
               path_sbxs = path_sbxs)

# stop h2o engine
h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)
```

---

check\_if\_optimize      *Function check\_if\_optimize.*

---

## Description

Purpose of this function is to verify trading system functionality by analysing profit factor on the last trades. Whenever trading robot has profit factor value below certain limit function will write a file log indicating which trading systems need to be maintained.

Learn by example how to manipulate data

## Usage

```
check_if_optimize(
  x,
  system_list,
  path_data,
  num_trades_to_consider = 3,
```

```

    profit_factor_limit = 0.7,
    write_mode = FALSE
  )

```

### Arguments

**x** - dataframe containing trading results

**system\_list** - dataframe containing a table with magic numbers used by robots. Stored in file Setup.csv

**path\_data** - string, path to the folder where optimization file should be written

**num\_trades\_to\_consider** - Number of trades to calculate profit factor

**profit\_factor\_limit** - Limit below which trading robot is considered not working properly

**write\_mode** - When true function will write result to the file located in the temporary directory

### Details

Whenever there will be not enough trades then empty file will be written to the destination

### Value

function returns a dataframe with systems that should be optimized

### Author(s)

(C) 2019,2021 Vladimir Zhbanko

### Examples

```

library(lazytrade)
library(magrittr)
library(dplyr)
library(readr)
library(lubridate)

path_data <- normalizePath(tempdir(),winslash = "/")

file.copy(from = system.file("extdata", "Setup.csv", package = "lazytrade"),
          to = file.path(path_data, "Setup.csv"), overwrite = TRUE)

system_list <- read_csv(file.path(path_data, "Setup.csv"))

data(profit_factorDF)

# without writing to the file
check_if_optimize(x = profit_factorDF,

```

```
system_list = system_list,  
path_data,  
num_trades_to_consider = 3,  
profit_factor_limit = 0.8,  
write_mode = TRUE)
```

---

create\_labelled\_data *Create labelled data*

---

## Description

FUNCTION create\_labelled\_data. PURPOSE: function gets price data of every currency in each column. It is splitting this data by periods and transposes the data. Additionally function is capable to label the data based on the simple logic. Each row will be assigned into 2 categories based on the difference between beginning and end of the row elements Finally all data will be stacked on top and joined into the table

Learn by example how to manipulate data

## Usage

```
create_labelled_data(x, n = 50, type = "regression")
```

## Arguments

x	- data set containing a table where 1st column is a Time index and other columns containing financial asset price values
n	- number of rows we intend to split and transpose the data to
type	- type of the label required. Can be either "classification" or "regression". "classification" will return either "BU" or "BE", "regression" will return the difference between first value and the last value in each row (in pips)

## Details

see more info in the udemy course self-learning-trading-robot

## Value

function returns transposed data. One column called 'LABEL' indicate achieved value of the label. Transposed values from every column are stacked one to each other

## Examples

```
library(dplyr)
library(magrittr)
library(readr)
library(lazytrade)

# usind a sample data
data(price_dataset)

# price change as a label
create_labelled_data(x = price_dataset, n = 75, type = "regression")

# factors 'BU'/'BE' as a label
create_labelled_data(x = price_dataset, n = 75, type = "classification")
```

---

create\_transposed\_data

*Create Transposed Data*

---

## Description

**PURPOSE:** function gets indicator data in each column. Goal is to splitting this data into periods and transpose the data.

Learn by example how to manipulate data

## Usage

```
create_transposed_data(x, n = 50)
```

## Arguments

x	- data set containing a table where 1st column is a Time index and other columns containing financial asset indicator values
n	- number of rows we intend to split and transpose the data

## Details

each column contains records of the indicator value of the assets every column will be split into chunks of n observations and transposed into rows this repeated for all the columns coming up with a matrix. Function works in combination with a function create\_labelled\_data

## Value

function returns transposed data. Transposed values from every column are stacked one to each other

## Examples

```
library(dplyr)

# usind a sample data
data(indicator_dataset)

create_transposed_data(indicator_dataset, n = 75)
```

---

data_trades	<i>Table with Trade results samples</i>
-------------	-----------------------------------------

---

## Description

Table with Trade results samples

## Usage

```
data_trades
```

## Format

A dataframe with several columns

**MagicNumber** Unique identifiers of the Trading Robots

**TicketNumber** Ticket Number of closed position

**OrderStartTime** Date and Time when order started

**OrderCloseTime** Date and Time when order closed

**Profit** Monetary result of the trade

**Symbol** Symbol of the Asset e.g. EURUSD

**OrderType** Order Type 0 - buy, 1 - sell

---

decrypt_mykeys	<i>Function that decrypt encrypted content</i>
----------------	------------------------------------------------

---

## Description

Function that decrypt encrypted content

## Usage

```
decrypt_mykeys(path_encrypted_content, path_private_key)
```

## Arguments

path\_encrypted\_content

- path to the encrypted content of the API key

path\_private\_key

- path to the private RSA key, should be without password

## Details

It is possible to generate private/public key pair using R-Studio Project Options Menu. Alternatively possible to use 'openssl' R package

## Value

- a string with decrypted key

## Examples

```
library(dplyr)
library(magrittr)
library(openssl)
library(readr)

path_ssh <- normalizePath(tempdir(),winslash = "/")
rsa_keygen() %>% write_pem(path = file.path(path_ssh, 'id_api'))
# extract and write your public key
read_key(file = file.path(path_ssh, 'id_api'), password = "") %>%
`[[`("pubkey") %>% write_pem(path = file.path(path_ssh, 'id_api.pub'))

path_private_key <- file.path(path_ssh, "id_api")
path_public_key <- file.path(path_ssh, "id_api.pub")

#encrypting string 'my_key'...
encrypt_api_key(api_key = 'my_key', enc_name = 'api_key.enc.rds',path_ssh = path_ssh)

#encrypted content
out <- read_rds(file.path(path_ssh, "api_key.enc.rds"))
```

```
# Consumer API keys
ConsumerAPIkeys <- decrypt_mykeys(path_encrypted_content = file.path(path_ssh,
                             'api_key.enc.rds'),
                             path_private_key = path_private_key)
```

DFR

*Table with predicted price change***Description**

Table with predicted price change

**Usage**

DFR

**Format**

A dataframe with one column

**"MagicNumber.x** Unique identifiers of the Trading Robots from Trade Log

**TicketNumber** Ticket Number of closed position

**OrderStartTime** Date and Time when order started

**OrderCloseTime** Date and Time when order closed

**Profit** Monetary result of the trade

**Symbol** Symbol of the Asset e.g. EURUSD

**OrderType** Order Type 0 - buy, 1 - sell

**"CUMSUM\_PNL** Cumulative sum of Profit and Loss

dlog

*Create log difference distribution***Description**

Transforms dataframe to the matrix

**Usage**

dlog(x)

**Arguments**

x - matrix with one or more column

**Value**

- dataframe

**Examples**

```
library(magrittr)
library(lazytrade)
m <- seq(1:1000) %>% as.matrix(10) %>% dlog()
```

---

encrypt_api_key	<i>Encrypt api keys</i>
-----------------	-------------------------

---

**Description**

Provide easy interface to encrypt the api key. In order to use function simply provide a string with an API key. In addition provide the path to the .ssh folder and names of the private and public keys

**Usage**

```
encrypt_api_key(
  api_key,
  enc_name = "api_key.enc.rds",
  path_ssh = "path_ssh",
  file_rsa = "id_api",
  file_rsa_pub = "id_api.pub"
)
```

**Arguments**

api_key	String with API key
enc_name	String with a name of the file with encrypted key. Default name is 'api_key.enc.rds'
path_ssh	String with path to the file with rsa keys. Same place will be used to store encrypted data
file_rsa	String with a name of the file with a private key. Default name is 'id_api'
file_rsa_pub	String with a name of the file with a public key. Default name is 'id_api.pub'

**Details**

Make sure to clean the history of the R session

**Value**

Writes a file with encrypted key

**References**

for more info on how to use RSA cryptography in R check my course <https://www.udemy.com/course/keep-your-secrets-under-control/?referralCode=5B78D58E7C06AFFD80AE>

**Examples**

```
library(openssl)
library(magrittr)
library(readr)
path_ssh <- normalizePath(tempdir(),winslash = "/")
rsa_keygen() %>% write_pem(path = file.path(path_ssh, 'id_api'))
# extract and write your public key
read_key(file = file.path(path_ssh, 'id_api'), password = "") %>%
  `[["pubkey"]) %>% write_pem(path = file.path(path_ssh, 'id_api.pub'))

path_private_key <- file.path(path_ssh, "id_api")
path_public_key <- file.path(path_ssh, "id_api.pub")

#encrypting string 'my_key'...
encrypt_api_key(api_key = 'my_key', enc_name = 'api_key.enc.rds', path_ssh = path_ssh)

out <- read_rds(file.path(path_ssh, "api_key.enc.rds"))

# decrypting the password using public data list and private key
api_key <- decrypt_envelope(out$data,
                           out$iv,
                           out$session,
                           path_private_key, password = "") %>%
  unserialize()

# outcome of the encryption will be a string 'my_key'
```

---

 EURUSDM15X75

*Table with indicator and price change dataset*

---

**Description**

Table with indicator and price change dataset

**Usage**

```
EURUSDM15X75
```

**Format**

A dataframe with several columns

**LABEL** future price change

**X1-X75** Values of the macd indicator

---

evaluate\_macroeconomic\_event

*Function used to evaluate market type situation by reading the file with  
Macroeconomic Events and writing a trigger to the trading robot*

---

**Description**

Function is reading the content of the file 01\_MacroeconomicEvent.csv. Content of the file can be either 1 or 0. 1 - when Macro Economic event is present, 0 - when it's not. Function will also read magic number of the trading robots. This is indicated in the file 'Setup.csv'. Final outcome of the function is the series of files written to the destination directories. These files will either enable or disable opening of new positions in the trading robots #'

**Usage**

```
evaluate_macroeconomic_event(  
    setup_file_path,  
    setup_file_name = "Setup.csv",  
    macro_event_path,  
    macro_file_name = "01_MacroeconomicEvent.csv",  
    path_T1,  
    path_T3  
)
```

**Arguments**

setup_file_path	string, path to the folder with Setup.csv file
setup_file_name	string, name of the file 'Setup.csv'
macro_event_path	string, path to the folder with a file '01_MacroeconomicEvent.csv'
macro_file_name	string, name of the file '01_MacroeconomicEvent.csv'
path_T1	Path of the Terminal 1
path_T3	Path of the Terminal 3

**Details**

This function is used exclusively with Market Type recognition system.

Final evaluation will consist in writing a dedicated file with a simple information:

When Macro economic even is not present:

```
"Magic","IsEnabled" 8139125,1
```

or, when Macro economic event is present:

```
"Magic","IsEnabled" 8139125,0
```

**Value**

Function will write files indicating to enable or disable trading systems to open new orders

**Examples**

```
# evaluate data on macroeconomic event (required to start trading)
library(dplyr)
library(readr)
library(lazytrade)

dir <- normalizePath(tempdir(),winslash = "/")

evaluate_macroeconomic_event(setup_file_path = system.file('extdata', package = "lazytrade"),
                             setup_file_name = "Setup.csv",
                             macro_event_path = system.file('extdata', package = "lazytrade"),
                             macro_file_name = "01_MacroeconomicEvent.csv",
                             path_T1 = dir, path_T3 = dir)
```

---

get\_profit\_factorDF     *Function that returns the profit factors of the systems in a form of a DataFrame*

---

**Description**

Function that returns the profit factors of the systems in a form of a DataFrame

**Usage**

```
get_profit_factorDF(x, num_orders)
```

**Arguments**

x                         - data frame with orders. Note x must contain MagicNumber and Profit columns!  
num\_orders                - desired number of orders to base profit factor calculation

**Value**

- Function returns dataframe with column PrFact with calculated profit factor value for each trading robot

**Examples**

```
library(lazytrade)
library(dplyr)
library(magrittr)
data(profit_factorDF)
get_profit_factorDF(x = profit_factorDF,
                    num_orders = 10)
```

---

import\_data

*Import Data file with Trade Logs to R.*

---

**Description**

Function is capable to import file with executed trades log. Files do not have column headers hence function will take care to name columns as well as to perform relevant cleansing

**Usage**

```
import_data(path_sbxm, trade_log_file)
```

**Arguments**

path\_sbxm - String, Path to the sandbox with the log file where the file with data is written  
trade\_log\_file - String, File name where the order results are written

**Value**

Function will return the dataframe with trade data and automatically set proper column types

**Author(s)**

(C) 2019, 2020 Vladimir Zhbanko

## Examples

```
library(lazytrade)
library(dplyr)
library(readr)
library(lubridate)

path_sbxm <- normalizePath(tempdir(), winslash = "/")

file.copy(from = system.file("extdata", "OrdersResultsT1.csv", package = "lazytrade"),
          to = file.path(path_sbxm, "OrdersResultsT1.csv"), overwrite = TRUE)

DFT1 <- import_data(path_sbxm = path_sbxm,
                    trade_log_file = "OrdersResultsT1.csv")
```

---

import\_data\_mt

*Import Market Type related Data to R from the Sandbox*

---

## Description

Function imports file from the MetaTrader sandbox. Function performs necessary cleansing of the data column types

## Usage

```
import_data_mt(path_terminal, trade_log_file, system_number, demo_mode = FALSE)
```

## Arguments

path\_terminal - path to the sandbox  
trade\_log\_file - direct path to the log file (used for demo purposes)  
system\_number - magic number id of the trading system  
demo\_mode - when true, uses sample datafile stored in the package

## Value

function returns the data frame with 3 columns including market type code

## Author(s)

(C) 2019 Vladimir Zhbanko

**Examples**

```
library(dplyr)
library(readr)
library(lazytrade)
import_data_mt(trade_log_file = system.file("extdata", "MarketTypeLog9139106.csv",
                                             package = "lazytrade"),
              demo_mode = TRUE)
```

---

indicator_dataset	<i>Table with indicator dataset</i>
-------------------	-------------------------------------

---

**Description**

Table with indicator dataset

**Usage**

```
indicator_dataset
```

**Format**

A dataframe with several columns

**X1** Date and time of the indicator sample

**X2-X29** Values of the assets

---

indicator_dataset_big	<i>Table with indicator dataset, 30000 rows</i>
-----------------------	-------------------------------------------------

---

**Description**

Table with indicator dataset, 30000 rows

**Usage**

```
indicator_dataset_big
```

**Format**

A dataframe with several columns

**X1** Date and time of the indicator sample

**X2-X29** Values of the assets

---

load_asset_data	<i>Load and Prepare Asset Data</i>
-----------------	------------------------------------

---

### Description

Function imports file with financial asset data. Each column represent one asset, rows represent observations. Values in specific columns will be normalized by dividing them by 100. This is specifically done for pairs with JPY. In addition, X1 column will be converted to the ymd\_hms format

### Usage

```
load_asset_data(  
  path_terminal,  
  trade_log_file,  
  time_period = 1,  
  data_depth = 50000  
)
```

### Arguments

path\_terminal - path to the MT4 terminal, string  
trade\_log\_file - csv file name where the data is stored, without ".csv"  
time\_period - data periodicity in minutes, can be 1, 15, 60  
data\_depth - collected data depth in rows. describe how many rows in original file to read

### Details

Works for both price and indicator values, function parameters allowing to import different files. File names are selected to account different time periodicity and amount of the data

### Value

- dataframe with asset data in columns where X1 column is in a POSIXct format

### Examples

```
library(readr)  
library(dplyr)  
library(lubridate)  
library(magrittr)  
path_terminal <- system.file("extdata", package = "lazytrade")  
  
# load and prepare prices data  
prices <- load_asset_data(path_terminal = path_terminal,  
  trade_log_file = "AI_CP",
```

```

        time_period = 60,
        data_depth = "300")

# load and prepare indicator data
macd <- load_asset_data(path_terminal = path_terminal,
                        trade_log_file = "AI_Macd",
                        time_period = 60,
                        data_depth = "300")

```

---

 macd\_100

---

*Table with indicator only used to train model, 128 col 1646 rows*

---

### Description

Table with indicator only used to train model, 128 col 1646 rows

### Usage

```
macd_100
```

### Format

A dataframe with several columns

**EURUSD** Values of the macd indicator

**GBPUSD** Values of the macd indicator

**AUDUSD** Values of the macd indicator

**NZDUSD** Values of the macd indicator

**USDCAD** Values of the macd indicator

**USDCHF** Values of the macd indicator

**USDJPY** Values of the macd indicator

**EURGBP** Values of the macd indicator

**EURJPY** Values of the macd indicator

**EURCHF** Values of the macd indicator

**EURNZD** Values of the macd indicator

**EURCAD** Values of the macd indicator

**EURAUD** Values of the macd indicator

**GBPAUD** Values of the macd indicator

**GBPCAD** Values of the macd indicator

**GBPCHF** Values of the macd indicator

**GBPJPY** Values of the macd indicator

**GBPNZD** Values of the macd indicator  
**AUDCAD** Values of the macd indicator  
**AUDCHF** Values of the macd indicator  
**AUDJPY** Values of the macd indicator  
**AUDNZD** Values of the macd indicator  
**CADJPY** Values of the macd indicator  
**CHFJPY** Values of the macd indicator  
**NZDJPY** Values of the macd indicator  
**NZDCAD** Values of the macd indicator  
**NZDCHF** Values of the macd indicator  
**CADCHF** Values of the macd indicator

macd\_df

*Table with one column indicator dataset***Description**

Table with one column indicator dataset

**Usage**

macd\_df

**Format**

A dataframe with one column

**CADCHF** Indicator values of the asset

macd\_ML60M

*Table with indicator and market type category used to train model***Description**

Table with indicator and market type category used to train model

**Usage**

macd\_ML60M

**Format**

A dataframe with several columns

**X1-X64** Values of the macd indicator**M\_T** Category of Market Type

---

mt_evaluate	<i>Function to score data and predict current market type using pre-trained classification model</i>
-------------	------------------------------------------------------------------------------------------------------

---

### Description

**PURPOSE:** Function that uses Deep Learning model and Time Series Column of the dataframe to find out specific market type of the financial asset it will also discard bad result outputting -1 if it is the case

### Usage

```
mt_evaluate(x, path_model, num_cols, timeframe)
```

### Arguments

x	- dataframe with one column containing asset indicator in the time descending order, typically 64 or more values
path_model	String, path to the model
num_cols	Integer, number of columns (features) in the final vector input to the model
timeframe	Integer, timeframe in Minutes.

### Details

it is mandatory to switch on the virtual h2o machine with `h2o.init()` also to shut it down with `h2o.shutdown(prompt = F)`

### Value

dataframe with predicted value of the market type

### Examples

```
library(h2o)
library(magrittr)
library(dplyr)
library(readr)
library(lazytrade)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

data(macd_ML60M)

# start h2o engine (using all CPU's by default)
```

```
h2o.init(nthreads = 2)

# performing Deep Learning Regression using the custom function
# this function stores model to the temp location
mt_make_model(indicator_dataset = macd_ML60M,
              num_bars = 64,
              timeframe = 60,
              path_model = path_model,
              path_data = path_data,
              activate_balance = TRUE,
              num_nn_options = 3)

# Use sample data
data(macd_100)

# use one column for testing
x <- macd_100[,2]

mt_evaluate(x = x,
            path_model = path_model,
            num_cols = 64,
            timeframe = 60)

h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)
```

---

mt\_import\_data

*Import Market Type related Data to R from the Sandbox*

---

### **Description**

Function imports file from the MetaTrader sandbox. Function performs necessary cleansing of the data column types

### **Usage**

```
mt_import_data(path_sbxm, system_number)
```

### **Arguments**

path\_sbxm - String, Path to the sandbox with the log file (master terminal)  
system\_number - magic number id of the trading system

**Value**

function returns the data frame with 5 columns including market type code

**Author(s)**

(C) 2020 Vladimir Zhabanko

**Examples**

```
library(dplyr)
library(readr)
library(lazytrade)

path_sbxm <- normalizePath(tempdir(), winslash = "/")

file.copy(from = system.file("extdata", "MarketTypeLog9139106.csv", package = "lazytrade"),
          to = file.path(path_sbxm, "MarketTypeLog9139106.csv"), overwrite = TRUE)

DF1 <- mt_import_data(path_sbxm = path_sbxm,
                     system_number = 9139106)
```

---

mt_make_model	<i>Function to train Deep Learning Classification model for Market Type recognition</i>
---------------	-----------------------------------------------------------------------------------------

---

**Description**

Function is training h2o deep learning model to match manually classified patterns of the financial indicator. Main idea is to be able to detect Market Type by solely relying on the current indicator pattern. This is in the attempt to evaluate current market type and to use proper trading strategy. Function will always try to gather more data to update the model.

Selected Market Periods according to the theory from Van K. Tharp: 1. Bull normal, BUN 2. Bull volatile, BUV 3. Bear normal, BEN 4. Bear volatile, BEV 5. Sideways quiet, RAN 6. Sideways volatile, RAV

**Usage**

```
mt_make_model(  
  indicator_dataset,  
  num_bars,  
  timeframe = 60,  
  path_model,  
  path_data,  
  activate_balance = TRUE,
```

```

    num_nn_options = 24,
    is_cluster = FALSE
  )

```

### Arguments

indicator_dataset	Dataframe, Dataset containing indicator patterns to train the model
numBars	Integer, Number of bars used to detect pattern
timeframe	Integer, Data timeframe in Minutes.
path_model	String, Path where the models are be stored
path_data	String, Path where the aggregated historical data is stored, if exists in rds format
activate_balance	Boolean, option to choose if to balance market type classes or not, default TRUE
num_nn_options	Integer, value from 3 to 24 or more. Used to change number of variants of the random neural network structures. Value 3 will mean that only one random structure will be used. To avoid warnings make sure to set this value multiple of 3. Higher values will increase computation time.
is_cluster	Boolean, set TRUE to use automatically clustered data

### Details

Function is using manually prepared dataset and tries several different random neural network structures. Once the best neural network is found then the better model is trained and stored.

### Value

Function is writing file object with the model

### Author(s)

(C) 2020 Vladimir Zhabanko

### Examples

```

library(dplyr)
library(magrittr)
library(readr)
library(h2o)
library(lazytrade)
library(stats)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

data(macd_ML60M)

```

```
Sys.sleep(5)

# start h2o engine
h2o.init(nthreads = 2)

# performing Deep Learning Classification using the custom function manually prepared data
mt_make_model(indicator_dataset = macd_ML60M,
              num_bars = 64,
              timeframe = 60,
              path_model = path_model,
              path_data = path_data,
              activate_balance = TRUE,
              num_nn_options = 3)

data(price_dataset_big)
data <- head(price_dataset_big, 500) #reduce computational time

ai_class <- mt_stat_transf(indicator_dataset = data,
                          num_bars = 64,
                          timeframe = 60,
                          path_data = path_data,
                          mt_classes = c('BUN', 'BEN', 'RAN'))

# performing Deep Learning Classification using the custom function auto clustered data
mt_make_model(indicator_dataset = ai_class,
              num_bars = 64,
              timeframe = 60,
              path_model = path_model,
              path_data = path_data,
              activate_balance = TRUE,
              num_nn_options = 3,
              is_cluster = TRUE)

# stop h2o engine
h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)
```

---

mt\_stat\_evaluate

*Function to prepare and score data, finally predict current market type using pre-trained classification model*

---

**Description**

**PURPOSE:** Function that uses Deep Learning model and Time Series Column of the dataframe to find out specific market type of the financial asset it will also discard bad result outputting -1 if it is the case

**Usage**

```
mt_stat_evaluate(x, path_model, num_bars, timeframe)
```

**Arguments**

x	- dataframe with one column containing asset indicator in the time descending order, typically 64 or more values
path_model	String, path to the model
num_bars	Integer, Number of bars used to perform transformation
timeframe	Integer, timeframe in Minutes.

**Details**

it is mandatory to switch on the virtual h2o machine with `h2o.init()` also to shut it down with `h2o.shutdown(prompt = F)`

**Value**

dataframe with predicted value of the market type

**Author(s)**

(C) 2021 Vladimir Zhbanko

**Examples**

```
library(h2o)
library(magrittr)
library(dplyr)
library(readr)
library(lazytrade)
library(stats)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

# start h2o engine (using all CPU's by default)
h2o.init(nthreads = 2)

data(price_dataset_big)
```

```

data <- head(price_dataset_big, 500) #reduce computational time

ai_class <- mt_stat_transf(indicator_dataset = data,
                          num_bars = 64,
                          timeframe = 60,
                          path_data = path_data,
                          mt_classes = c('BUN', 'BEN', 'RAN'))

# performing Deep Learning Classification using the custom function auto clustered data
mt_make_model(indicator_dataset = ai_class,
              num_bars = 64,
              timeframe = 60,
              path_model = path_model,
              path_data = path_data,
              activate_balance = TRUE,
              num_nn_options = 3,
              is_cluster = TRUE)

# Use sample data
data(price_dataset)

# use one column for testing
x <- price_dataset[,2]

mt_stat_evaluate(x = x,
                 path_model = path_model,
                 num_bars = 64,
                 timeframe = 60)

h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)

```

---

mt_stat_transf	<i>Perform Statistical transformation and clustering of Market Types on the price data</i>
----------------	--------------------------------------------------------------------------------------------

---

## Description

Function features methods of statistical data transformation and clustering of the price data. Multiple statistical properties are calculated for a defined time interval. Once combined, unsupervised learning (clustering) is performed to assign several classes, see function 'mt\_make\_model'. Function allows to fully automatize financial periods classification. It is possible to choose two clustering methods either kmeans or hierarchical clustering.

**Usage**

```
mt_stat_transf(
  indicator_dataset,
  num_bars = 64,
  timeframe = 60,
  path_data,
  mt_classes,
  clust_method = "kmeans",
  clust_opt = "complete"
)
```

**Arguments**

indicator_dataset	Dataframe, multiple column dataset containing price data in each column. Each row is a time index, multiple columns are required but not strictly needed
num_bars	Integer, Number of bars used to perform transformation
timeframe	Integer, Data timeframe in Minutes, only used for naming convention
path_data	String, User path where the dataset could be stored for the future use by other function
mt_classes	Character Vector, with 2 or more Market Type classes
clust_method	Character, option to select which clustering method to choose. Could be either 'kmeans' or 'hclust'. Default value is 'kmeans'
clust_opt	Character, option to select how to perform h clustering "average", "single", "complete", "ward". Default value is 'complete'

**Details**

User can define several market type classes names however function will randomly assign Market Period labels based on Unsupervised Learning. This is inconvenient however that should be compensated by automated way of doing such data classification

**Value**

Dataframe with statistically transformed and classified dataset for classification modeling

**Author(s)**

(C) 2021 Vladimir Zhbanko

**Examples**

```
library(dplyr)
library(stats)
library(magrittr)
library(readr)
```

```
library(lazytrade)

path_data <- normalizePath(tempdir(), winslash = "/")

data(price_dataset_big)

#option
#mt_classes = c('BUN', 'BEN', 'RAN', 'BUV', 'BEV', 'RAV')
#clust_method = 'hclust'
#clust_opt = 'ward'

mt_stat_transf(indicator_dataset = price_dataset_big,
               numBars = 64,
               timeframe = 60,
               path_data = path_data,
               mt_classes = c('BUN', 'BEN', 'RAN'),
               clust_method = 'kmeans',
               clust_opt = 'complete')
```

---

opt\_aggregate\_results *Function to aggregate trading results from multiple folders and files*

---

### Description

PURPOSE: Read multiple '.csv' files stored in different folders Store results to the intermediate dataframe.

### Usage

```
opt_aggregate_results(path_data)
```

### Arguments

path\_data - String, path to the folder containing subfolders

### Details

user must provide the path to the files in the folders all files in subfolders are read and aggregated into one data object. Data object is sorted in descending order by order close time

### Value

Dataframe with trading results

## Examples

```
library(lazytrade)
library(readr)
library(dplyr)
library(magrittr)
library(lubridate)

dir <- normalizePath(tempdir(),winslash = "/")

file.copy(from = system.file("extdata/RES", package = "lazytrade"),
          to = dir, recursive = TRUE)

DF_RES <- opt_aggregate_results(path_data = file.path(dir, "RES"))
```

---

opt\_create\_graphs      *Function to create summary graphs of the trading results*

---

## Description

Create graphs and store them into pdf file

## Usage

```
opt_create_graphs(x, outp_path, graph_type = "pdf")
```

## Arguments

x	- dataframe with aggregated trading results
outp_path	- path to the folder where to write file
graph_type	- character, one of the options c('ts', 'bars', 'pdf')

## Details

bar graph and time series optionally written to the pdf file. File is named with a date of analysis to the location specified by the user

## Value

graphic output

**Examples**

```

library(lazytrade)
library(readr)
library(dplyr)
library(magrittr)
library(lubridate)
library(ggplot2)
data(DFR)
dir <- normalizePath(tempdir(),winslash = "/")
# create pdf file with two graphs
opt_create_graphs(x = DFR, outp_path = dir)

# only show time series plot
opt_create_graphs(x = DFR, graph_type = 'ts')

```

---

policy_tr_systDF	<i>Table with Market Types and sample of actual policy for those states</i>
------------------	-----------------------------------------------------------------------------

---

**Description**

Table with Market Types and sample of actual policy for those states

**Usage**

```
policy_tr_systDF
```

**Format**

A dataframe with 2 columns:

**MarketType** Current Market Type status

**Policy** Policy choice

---

price_dataset	<i>Table with price dataset</i>
---------------	---------------------------------

---

**Description**

Table with price dataset

**Usage**

```
price_dataset
```

**Format**

A dataframe with several columns

**X1** Date and time of the price sample

**X2-X29** Values of the assets

---

price\_dataset\_big      *Table with price dataset, 30000 rows*

---

**Description**

Table with price dataset, 30000 rows

**Usage**

price\_dataset\_big

**Format**

A dataframe with several columns

**X1** Date and time of the price sample

**X2-X29** Values of the assets

---

profit\_factorDF      *Table with Trade results samples*

---

**Description**

Table with Trade results samples

**Usage**

profit\_factorDF

**Format**

A dataframe with several columns

**MagicNumber** Unique identifiers of the Trading Robots

**TicketNumber** Ticket Number of closed position

**OrderStartTime** Date and Time when order started

**OrderCloseTime** Date and Time when order closed

**Profit** Monetary result of the trade

**Symbol** Symbol of the Asset e.g. EURUSD

**OrderType** Order Type 0 - buy, 1 - sell

---

profit\_factor\_data      *Table with Trade results samples*

---

**Description**

Table with Trade results samples

**Usage**

profit\_factor\_data

**Format**

A dataframe with several columns

**X1** Unique identifiers of the Trading Robots

**X2** Ticket Number of closed position

**X3** Date and Time when order started

**X4** Date and Time when order closed

**X5** Monetary result of the trade

**X6** Symbol of the Asset e.g. EURUSD

**X7** Order Type 0 - buy, 1 - sell

---

result\_prev      *Table with one column as result from the model prediction*

---

**Description**

Table with one column as result from the model prediction

**Usage**

result\_prev

**Format**

A dataframe with one column

**predict** Predicted values from the model

---

result_R	<i>Table with predicte price change</i>
----------	-----------------------------------------

---

**Description**

Table with predicte price change

**Usage**

result\_R

**Format**

A dataframe with one column

**predict** predicted future price change

---

result_R1	<i>Table with aggregated trade results</i>
-----------	--------------------------------------------

---

**Description**

Table with aggregated trade results

**Usage**

result\_R1

**Format**

A dataframe with one column

**predict** predicted price change

---

rl_generate_policy	<i>Function performs Reinforcement Learning using the past data to generate model policy</i>
--------------------	----------------------------------------------------------------------------------------------

---

### Description

This function will perform Reinforcement Learning using Trading Data. It will suggest whether or not it is better to keep using trading systems or not. Function is just using results of the past performance to generate the recommendation (not a holy grail).

### Usage

```
rl_generate_policy(x, states, actions, control)
```

### Arguments

x	- Dataframe containing trading data
states	- Character vector, Selected states of the System
actions	- Character vector, Selected actions executed under environment
control	- List, control parameters as defined in the Reinforcement Learning Package

### Details

Initial policy is generated using a dummy zero values. This way function starts working directly from the first observation. However policy 'ON' value will only be generated once the Q value is greater than zero

### Value

Function returns data frame with reinforcement learning model policy

### Author(s)

(C) 2019,2021 Vladimir Zhabanko

### Examples

```
library(dplyr)
library(ReinforcementLearning)
library(magrittr)
library(lazytrade)

data(data_trades)
states <- c("tradewin", "tradeloss")
actions <- c("ON", "OFF")
control <- list(alpha = 0.7, gamma = 0.3, epsilon = 0.1)
rl_generate_policy(x = data_trades,
```

```
states, actions, control)
```

---

rl\_generate\_policy\_mt *Function performs RL and generates model policy for each Market Type*

---

### Description

This function will perform Reinforcement Learning using Trading Data. It will suggest whether or not it is better to keep using trading systems or not. Function is just using results of the past performance to generate the recommendation (not a holy grail).

### Usage

```
rl_generate_policy_mt(x, states, actions, control)
```

### Arguments

x	- Dataframe containing trading data
states	- Character vector, Selected states of the System
actions	- Character vector, Selected actions executed under environment
control	- List, control parameters as defined in the Reinforcement Learning Package

### Details

Initial policy is generated using a dummy zero values. This way function starts working directly from the first observation. However policy 'ON' value will only be generated once the Q value is greater than zero

### Value

Function returns data frame with reinforcement learning model policy

### Examples

```
library(dplyr)
library(magrittr)
library(ReinforcementLearning)
library(lazytrade)
data(trading_systemDF)
states <- c("BUN", "BUV", "BEN", "BEV", "RAN", "RAV")
actions <- c("ON", "OFF")
control <- list(alpha = 0.7, gamma = 0.3, epsilon = 0.1)
rl_generate_policy_mt(x = trading_systemDF,
                     states = states,
```

```
actions = actions,
control = control)
```

---

rl\_log\_progress      *Function to retrieve and help to log Q values during RL progress.*

---

### Description

Function will record Q values during the model update. These values will be used by another function Function was developed to help to estimate best control parameters during optimisation process

### Usage

```
rl_log_progress(x, states, actions, control)
```

### Arguments

x	- dataframe containing trading results
states	- Selected states of the System
actions	- Selected actions executed under environment
control	- control parameters as defined in the Reinforcement Learning Package

### Value

dataframe with log of RL model reward sequences during model update

### Examples

```
# retrieve RL model Q values progress
library(ReinforcementLearning)
library(dplyr)
library(magrittr)
library(lazytrade)
data(data_trades)
x <- data_trades
states <- c("tradewin", "tradeloss")
actions <- c("ON", "OFF")
control <- list(alpha = 0.7, gamma = 0.3, epsilon = 0.1)

rl_log_progress(x = x, states = states, actions = actions, control = control)
```

---

rl\_log\_progress\_mt      *Function to retrieve and help to log Q values during RL progress. This function is dedicated to the situations when Market Types are used as a 'states' for the Environment.*

---

### Description

Function will record Q values during the model update. These values will be used by another function Function was developed to help to estimate best control parameters during optimisation process

### Usage

```
rl_log_progress_mt(x, states, actions, control)
```

### Arguments

x                      - dataframe containing trading results  
states                 - Selected states of the System  
actions                - Selected actions executed under environment  
control                - control parameters as defined in the Reinforcement Learning Package

### Value

dataframe with log of RL model reward sequences during model update

### Author(s)

(C) 2020, 2021 Vladimir Zhbanko

### Examples

```
# retrieve RL model Q values progress
library(ReinforcementLearning)
library(dplyr)
library(magrittr)
library(lazytrade)
data(trading_systemDF)
x <- trading_systemDF
states <- c("BUN", "BUY", "BEN", "BEV", "RAN", "RAV")
actions <- c("ON", "OFF") # 'ON' and 'OFF' are referring to decision to trade with Slave system
control <- list(alpha = 0.7, gamma = 0.3, epsilon = 0.1)

rl_log_progress_mt(x = x, states = states, actions = actions, control = control)
```

---

rl\_record\_policy      *Record Reinforcement Learning Policy.*

---

### Description

Function will write a policy 'decision' to the csv file specific for each Expert Advisor

### Usage

```
rl_record_policy(  
  x,  
  last_result,  
  trading_system,  
  path_terminal,  
  fileName = "SystemControl"  
)
```

### Arguments

x                    - Dataframe containing columns MarketType and Policy  
last\_result        - character vector of the last result of the trade  
trading\_system    - character vector of length 1 with Trading System Magic Number information  
path\_terminal     - path to the sandbox where this Policy/Decision must be written  
fileName           - string, desired control file prefix e.g. 'SystemControl'

### Value

nothing is returned but function will write csv file to the supplied directory

### Author(s)

(C) 2019,2021 Vladimir Zhbanko

### Examples

```
library(stringr)  
library(magrittr)  
library(dplyr)  
data(TradeStatePolicy)  
  
dir <- normalizePath(tempdir(),winslash = "/")  
  
rl_record_policy(x = TradeStatePolicy,  
  last_result = "tradewin",  
  trading_system = 8118101,
```

```
path_terminal = dir,  
fileName = "SystemControlRL")
```

---

rl\_record\_policy\_mt     *Record Reinforcement Learning Policy for Market Types*

---

### Description

Function will write a policy 'decision' to the csv file specific for each Expert Advisor

### Usage

```
rl_record_policy_mt(  
  x,  
  trading_system,  
  path_terminal,  
  fileName = "SystemControlMT"  
)
```

### Arguments

x                    - Dataframe containing columns MarketType and Policy  
trading\_system     - numeric vector of length 1 with Trading System Magic Number information  
path\_terminal      - string, path to the terminal where this Policy/Decision must be written  
fileName            - string, desired control file prefix e.g. 'SystemControlMT'

### Value

nothing is returned but function will write csv file to the supplied directory

### Examples

```
library(stringr)  
library(lazytrade)  
data(policy_tr_systDF)  
  
dir <- normalizePath(tempdir(),winslash = "/")  
  
rl_record_policy_mt(x = policy_tr_systDF,  
  trading_system = 8118101,  
  path_terminal = dir,  
  fileName = "SystemControlMT")
```

---

`rl_write_control_parameters`*Function to find and write the best control parameters.*

---

### Description

This function is supposed to run on a weekly basis. Purpose of this function is to perform RL and trading simulation and find out the best possible control parameters for the RL function.

### Usage

```
rl_write_control_parameters(  
  x,  
  path_control_files,  
  num_trades_to_consider = 100  
)
```

### Arguments

`x` - dataset containing the trading results for one trading robot  
`path_control_files` - path where control parameters will be saved  
`num_trades_to_consider` - number of last trades to use for RL modeling simulations, default value 100

### Details

Function is used by the R script `Adapt_RL_control.R`

### Value

Function writes best control parameters to be used by the Reinforcement Learning Function

### Author(s)

(C) 2019 Vladimir Zhabanko

### Examples

```
dir <- normalizePath(tempdir(), winslash = "/")  
#test lasts 15 sec:  
library(dplyr)  
library(readr)  
library(ReinforcementLearning)  
library(magrittr)
```

```
library(lazytrade)
data(data_trades)
x <- data_trades
rl_write_control_parameters(x = data_trades,
                           path_control_files = dir,
                           num_trades_to_consider = 20)
```

---

rl\_write\_control\_parameters\_mt

*Function to find and write the best control parameters.*

---

### Description

This function is supposed to run on a weekly basis. Purpose of this function is to perform RL and trading simulation and find out the best possible control parameters for the RL function.

### Usage

```
rl_write_control_parameters_mt(
  x,
  path_control_files,
  num_trades_to_consider = 100
)
```

### Arguments

x - dataset containing the trading results for one trading robot  
path\_control\_files - path where control parameters will be saved  
num\_trades\_to\_consider - number of last trades to use for RL modeling simulations, default value 100

### Details

Function is used by the R script Adapt\_RL\_MT\_control.R

### Value

Function writes best control parameters to be used by the Reinforcement Learning Function

### Author(s)

(C) 2019, 2021 Vladimir Zhbanks

## Examples

```
# test lasts 15 sec:
dir <- normalizePath(tempdir(),winslash = "/")

library(dplyr)
library(readr)
library(ReinforcementLearning)
library(magrittr)
library(lazytrade)
data(trading_systemDF)

# use optimal control parameters found by auxiliary function
rl_write_control_parameters_mt(x = trading_systemDF,
                              path_control_files = dir,
                              num_trades_to_consider = 100)
```

---

self\_learn\_ai\_R

*Function to train Deep Learning regression model*

---

## Description

Function is training h2o deep learning model to match future prices of the asset to the indicator pattern. Main idea is to be able to predict future prices by solely relying on the most recent indicator pattern.

## Usage

```
self_learn_ai_R(
  price_dataset,
  indicator_dataset,
  num_bars,
  timeframe,
  path_model,
  setup_mode = FALSE,
  research_mode = FALSE,
  write_log = TRUE
)
```

## Arguments

`price_dataset` Dataset containing assets prices. It will be used as a label  
`indicator_dataset` Dataset containing assets indicator which pattern will be used as predictor

num_bars	Number of bars used to detect pattern
timeframe	Data timeframe e.g. 1 min
path_model	Path where the models are be stored
setup_mode	When TRUE function will attempt to write model to the disk without checking it
research_mode	When TRUE model will be saved and model result will be stored as well. To be used at the first run.
write_log	Writes results of the newly trained model and previously used model to the file

### Details

Performs data manipulation and training of the model. Function is handling shift of the price and indicator datasets. Function will also check how the model predict by using trading objective. NOTE: Always run parameter research\_mode = TRUE for the first time

Because of the function is intended to periodically re-train the model it would always check how the previous model was working. In case new model is better, the better model will be used.

Function can also write a log files with a results of the strategy test

### Value

Function is writing files into Decision Support System folder

### Author(s)

(C) 2019 Vladimir Zhbanko

### Examples

```
library(dplyr)
library(readr)
library(magrittr)
library(h2o)
library(lazytrade)
# start h2o engine
h2o.init(nthreads = 2)

path_model <- normalizePath(tempdir(),winslash = "/")
path_data <- normalizePath(tempdir(),winslash = "/")

data(indicator_dataset_big)
data(price_dataset_big)

prices <- price_dataset_big
macd <- indicator_dataset_big

# performing Deep Learning Regression using the custom function
```

```

self_learn_ai_R(price_dataset = prices,
                indicator_dataset = macd,
                num_bars = 75,
                timeframe = 60,
                path_model = path_model,
                setup_mode = FALSE,
                research_mode = FALSE,
                write_log = FALSE)

# stop h2o engine
h2o.shutdown(prompt = FALSE)

#set delay to insure h2o unit closes properly before the next test
Sys.sleep(5)

```

---

test_data_pattern	<i>Table with several columns containing indicator values and Label values</i>
-------------------	--------------------------------------------------------------------------------

---

### Description

Table with several columns containing indicator values and Label values

### Usage

```
test_data_pattern
```

### Format

A dataframe with several columns

**LABEL** Asset values as were recorded in the future

**V1-V49** Transposed values of the indicator

---

test_model	<i>Test model using independent price data.</i>
------------	-------------------------------------------------

---

### Description

Goal of the function is to verify how good predicted results are.

### Usage

```
test_model(test_dataset, predictor_dataset, test_type)
```

### Arguments

`test_dataset` - Dataset containing the column 'LABEL' which will correspond to the real outcome of Asset price change. This column will be used to verify the trading strategy

`predictor_dataset` - Dataset containing the column 'predict'. This column is corresponding to the predicted outcome of Asset change. This column will be used to verify strategy outcomes

`test_type` can be either "regression" or "classification" used to distinguish which type of model is being used

### Details

This function should work to backtest any possible dataset length. It could be that we will need to use it for testing 1 week or 1 month. It should also work for both Regression and Classification models. Note: strategy outcomes assumes trading on all 28 major forex pairs

### Value

Function will return a data frame with several quality score metrics for the best model. In case quality score is positive or more than 1 the model would likely be working good. In case the score will be negative then the model is not predicting good. Internal logic will test several predictor thresholds and will indicate the best one

### Examples

```
library(dplyr)
data(result_prev)
data(test_data_pattern)

## evaluate hypothetical results of trading using the model
test_model(test_dataset = test_data_pattern,
           predictor_dataset = result_prev,
           test_type = "regression")
```

---

to_m	<i>Convert time series data to matrix with defined number of columns</i>
------	--------------------------------------------------------------------------

---

**Description**

Transforms Time Series Column of the dataframe to the matrix with specified number of columns. Number of rows will be automatically found. Eventually not complete last row will be discarded

**Usage**

```
to_m(x, n_cols)
```

**Arguments**

x	- dataframe with one column
n_cols	- number of columns in the matrix

**Value**

- matrix with specified amount of rows

**Examples**

```
library(magrittr)
macd_m <- seq(1:1000) %>% as.data.frame() %>% to_m(64)
```

---

TradeStatePolicy	<i>Table with Trade States and sample of actual policy for those states</i>
------------------	-----------------------------------------------------------------------------

---

**Description**

Table with Trade States and sample of actual policy for those states

**Usage**

```
TradeStatePolicy
```

**Format**

A dataframe with 2 columns:

**TradeState** Current trade state status

**Policy** Policy choice

---

trading_systemDF	<i>Table with trade data and joined market type info</i>
------------------	----------------------------------------------------------

---

**Description**

Table with trade data and joined market type info

**Usage**

trading\_systemDF

**Format**

A dataframe with several columns

**"MagicNumber.x** Unique identifiers of the Trading Robots from Trade Log

**TicketNumber** Ticket Number of closed position

**OrderStartTime** Date and Time when order started

**OrderCloseTime** Date and Time when order closed

**Profit** Monetary result of the trade

**Symbol** Symbol of the Asset e.g. EURUSD

**OrderType** Order Type 0 - buy, 1 - sell

**"MagicNumber.y** Unique identifiers of the Trading Robots from Ticket Opening Log

**"MarketType** Logged Market Type of the asset at the moment of Ticket Opening

---

util\_generate\_password

*R function to generate random passwords for MT4 platform or other needs*

---

**Description**

Utility function to generate random passwords. Wrapper of cryptographic functions from 'openssl' library in R. Password length can be customized. By default function just output randomly generated 8 symbol password suitable for MT4 logins. It is also possible to create other passwords and include special symbols. When required, it's possible to write resulting password to the txt file. Once generated, password is written to the destination supplied by the user.

**Usage**

```
util_generate_password(  
  salt = "something random",  
  pass_len = 8,  
  write_file = FALSE,  
  file_name = "",  
  special_symbols = FALSE  
)
```

**Arguments**

salt	string, random text supplied by the user
pass_len	integer, number specifying how long should the password be
write_file	bool, if true writes result to the txt file
file_name	string, indicate path of the file where to write text result
special_symbols	bool, if true adds special symbols

**Details**

Passwords are generated using sha512 cryptographic function from openssl package. System date and user 'salt' is used to supply initial text for cryptographic function. Hashing function is using additional 'salt' which will be based on the current System time. Additionally, only a part of generated string is selected and used for password. Some letters of generated string are converted from lower to upper case.

**Value**

string or text file with password

**Author(s)**

(C) 2019 Vladimir Zhbanko

**Examples**

```
library(stringr)  
library(magrittr)  
library(openssl)  
library(readr)  
  
dir <- normalizePath(tempdir(),wincslashes = "/")  
file_path <- file.path(dir, 'p.txt')  
  
#write to file  
util_generate_password(salt = 'random text', file_name = file_path)  
  
#generate 8digit
```

```
util_generate_password(salt = 'random text')

#generate password with special symbols
util_generate_password(salt = 'random text', special_symbols = TRUE)

#generate longer password with special symbols
util_generate_password(salt = 'random text', pass_len = 10, special_symbols = TRUE)
```

---

util\_profit\_factor      *Calculate Profit Factor*

---

## Description

Calculate profit factor using a data vector with the trading results

## Usage

```
util_profit_factor(x)
```

## Arguments

x                      column vector with profit or loss of the orders for one system

## Value

function should calculate profit factor for this vector and return one value also as vector

## Author(s)

(C) 2019 Vladimir Zhibanko

## Examples

```
library(magrittr)
library(dplyr)
library(lazytrade)
data(profit_factor_data)
profit_factor_data %>%
  group_by(X1) %>%
  summarise(PnL = sum(X5),
            NumTrades = n(),
            PrFact = util_profit_factor(X5)) %>%
  select(PrFact) %>% head(1) %>% as.vector() %>% round(3)
```

---

write\_command\_via\_csv *Write csv files with indicated commands to the external system*

---

### Description

Function is capable to read the data and writing multiple files e.g. 'SystemControl8139124.csv'

### Usage

```
write_command_via_csv(x, path_terminal = "", fileName = "SystemControl")
```

### Arguments

x - dataframe object with resulting command e.g. 1 - enable; 0 - disable  
path\_terminal - path to the terminal  
fileName - desired control file prefix e.g. 'SystemControl'

### Value

Function is writing multiple files e.g. 'SystemControl8139124.csv' to the Sandbox  
typical content of the file: "Magic","IsEnabled" 8139124,1

### Author(s)

(C) 2019 Vladimir Zhbanko

### Examples

```
library(dplyr)
library(readr)
library(lubridate)
library(lazytrade)

path_sbxm <- normalizePath(tempdir(),winslash = "/")

file.copy(from = system.file("extdata", "OrdersResultsT1.csv", package = "lazytrade"),
          to = file.path(path_sbxm, "OrdersResultsT1.csv"), overwrite = TRUE)

DFT1 <- import_data(path_sbxm = path_sbxm,
                    trade_log_file = "OrdersResultsT1.csv")

DFT1 %>%
  group_by(MagicNumber) %>% select(MagicNumber) %>% mutate(IsEnabled = 0) %>%
  # head to shorten time of this example
  head(2) %>%
  # write commands to disable/enable systems
  write_command_via_csv(path_terminal = path_sbxm)
```

---

write_ini_file	<i>Create initialization files to launch MT4 platform with specific configuration</i>
----------------	---------------------------------------------------------------------------------------

---

### Description

Function generate initialization files suitable for launching MT4 terminal with specific parameters. Several options available for generating files specific for each purpose. Option 'prod' will just use existing profile and connect to the broker server Option 'backtest' will generate file for the robot backtest Option 'opt' will generate file needed for the robot optimization Option 'full' allows to specify any desired parameter

### Usage

```
write_ini_file(  
    mt4_Profile = "Default",  
    mt4_MarketWatch = "Forex.set",  
    mt4_Login = "1234567",  
    mt4_Password = "xxxxxX",  
    mt4_Server = "BrokerServerName",  
    mt4_AutoConfiguration = "false",  
    mt4_EnableNews = "false",  
    mt4_ExpertsEnable = "true",  
    mt4_ExpertsDllImport = "true",  
    mt4_ExpertsExpImport = "true",  
    mt4_ExpertsTrades = "true",  
    mt4_Symbol = "EURUSD",  
    mt4_Period = "H1",  
    mt4_Template = "Default",  
    mt4_Expert = "",  
    mt4_ExpertParameters = "",  
    mt4_Script = "",  
    mt4_ScriptParameters = "",  
    mt4_TestExpert = "",  
    mt4_TestExpertParameters = "",  
    mt4_TestSymbol = "EURUSD",  
    mt4_TestPeriod = "H1",  
    mt4_TestModel = "",  
    mt4_TestSpread = "",  
    mt4_TestOptimization = "false",  
    mt4_TestDateEnable = "true",  
    mt4_TestFromDate = "",
```

```

mt4_TestToDate = "",
mt4_TestReport = "test report",
mt4_TestReplaceReport = "false",
mt4_TestShutdownTerminal = "",
mt4_TestVisualEnable = "false",
dss_inifilepath = "",
dss_inifilename = "test.ini",
dss_mode = "prod"
)

```

## Arguments

mt4_Profile	string, the subdirectory name in the /profiles directory. The charts will be opened in the client terminal according to the given profile. If this parameter is not specified, the current profile will be opened
mt4_MarketWatch	string, file name (the symbolsets directory) that contains the symbol list to be shown in the Market Watch window.
mt4_Login	string, the number of the account to connect to at startup. If this parameter is not specified, the current login will be used.
mt4_Password	string, the password that allows entering the system. This parameter will be ignored if the client terminal stores personal data on the disk and the account to be connected is in the list
mt4_Server	string, the name of the trade server to be connected to. The server name is the same as the name of the corresponding .srv file stored in the /config directory
mt4_AutoConfiguration	string, "true" or "false" depending on whether the autoconfiguration of Data Center setting should be enabled or not. If this parameter is not specified, the value from the current server settings will be used.
mt4_EnableNews	string, either 'false' or 'true'
mt4_ExpertsEnable	string, enable/disable experts.
mt4_ExpertsDllImport	string, enable/disable DLL imports
mt4_ExpertsExpImport	string, enable/disable import of functions from external experts or MQL4 libraries.
mt4_ExpertsTrades	string, enable/disable the experts trading
mt4_Symbol	string, the symbol of the security the chart of which should be opened immediately after the terminal startup
mt4_Period	string, the chart timeframe (M1, M5, M15, M30, H1, H4, D1, W1, MN). If this parameter is not specified, H1 is used
mt4_Template	string, the name of the template file (the templates directory), which should be applied to the chart.

mt4_Expert	string, the name of the expert that should be launched after the client terminal has started
mt4_ExpertParameters	string, the name of the file containing the expert parameters (the MQL4 Presets directory).
mt4_Script	string, the name of the script, which must be launched after the client terminal startup
mt4_ScriptParameters	string, the name of the file containing the script parameters (the MQL5 Presets directory).
mt4_TestExpert	string, the name of the expert to be launched for testing. If this parameter has not been specified, no testing is launched.
mt4_TestExpertParameters	string, the name of the file containing parameters (the tester directory).
mt4_TestSymbol	string, the name of the symbol used for the expert testing. If this parameter has not been specified, the latest value used in the tester is used.
mt4_TestPeriod	string, the chart period (M1, M5, M15, M30, H1, H4, D1, W1, MN). If this parameter has not been specified, H1 is used.
mt4_TestModel	string, 0, 1, or 2, depending on the testing model (Every tick, Control points, Open prices only). If this parameter has not been specified, 0 is used (Every tick)
mt4_TestSpread	string, spread value that will be used for modeling Ask prices during testing. If 0 value is specified, the strategy tester will use the current spread of a symbol at the beginning of testing
mt4_TestOptimization	string, enable/disable optimization. The values that can be taken are "true" or "false". If this parameter had not been specified, the "false" value is used.
mt4_TestDateEnable	string, enable/disable the "Use date" flag. The values that can be taken are "true" or "false". If this parameter had not been specified, the "false" value is used.
mt4_TestFromDate	string, the date, from which to start testing, appeared as YYYY.MM.DD. If this parameter has not been specified, this date is 1970.01.01.
mt4_TestToDate	string, the date, on which to finish testing, appeared as YYYY.MM.DD. If this parameter has not been specified, this date is 1970.01.01.
mt4_TestReport	string, the name of the test report file. The file will be created in the client terminal directory. A relative path can be specified, for example: tester \MovingAverageReport". If the extension has not been specified in the file name, the ".htm" will be set automatically. If this parameter has not been specified, the test report will not be formed
mt4_TestReplaceReport	string, enable/disable the repeated report file record. The values that can be taken are "true" or "false"
mt4_TestShutdownTerminal	string, enable/disable shutdown of the terminal after the testing has been finished.

mt4\_TestVisualEnable  
 string, enable (true) or disable (false) the visual test mode. If the parameter is not specified, the current setting is used.

dss\_inifilepath  
 string, path on the computer where file will be stored

dss\_inifilename  
 string, file name that should be written

dss\_mode  
 string,

### Details

added value of this function is the ability to generate multiple files to backtest several robots for several timeframes. For example it solves the problem of doing repetitive tasks to 'backtest' robots for several currencies and repeat this procedure over time.

Most of the variables present in the function are starting with a prefix mt4\_, the remainder of the name comes from the platform documentation, see references

Remaining variables are named with a prefix 'dss\_' stands for 'Decision Support System', as these are the variables used for further automation purposes

Note that for simplicity reasons not all parameters are present in this function. e.g. FTP Settings and Proxy Server settings are not present

### Value

output is a file with desired parameters

### Author(s)

(C) 2019 Vladimir Zhabanko

### References

All parameters used are taken from the reference documentation [https://www.metatrader4.com/en/trading-platform/help/service/start\\_conf\\_file](https://www.metatrader4.com/en/trading-platform/help/service/start_conf_file)

### Examples

```
library(lazytrade)

dir <- normalizePath(tempdir(), winslash = "/")

# test file to launch MT4 terminal with parameters
write_ini_file(mt4_Profile = "Default",
              mt4_Login = "12345678",
              mt4_Password = "password",
              mt4_Server = "BrokerServerName",
              dss_inifilepath = dir,
              dss_inifilename = "prod_T1.ini",
              dss_mode = "prod")
```

```

# test file to launch robot backtest
T0 <- format(as.Date(Sys.Date()), "%Y.%m.%d")
FROM <- format(as.Date(Sys.Date()-60), "%Y.%m.%d")

# test file for MT4 use for backtesting
write_ini_file(mt4_Profile = "Default",
              mt4_Login = "12345678",
              mt4_Password = "password",
              mt4_Server = "BrokerServerName",
              mt4_TestExpert="FALCON_D\\Falcon_D",
              mt4_TestExpertParameters="Falcon_D.set",
              mt4_TestSymbol="EURUSD",
              mt4_TestPeriod="H1",
              mt4_TestModel="2",
              mt4_TestSpread="20",
              mt4_TestOptimization="false",
              mt4_TestDateEnable="true",
              mt4_TestFromDate=FROM,
              mt4_TestToDate=T0,
              mt4_TestReport="EURUSD_Report",
              mt4_TestReplaceReport="false",
              mt4_TestShutdownTerminal="true",
              mt4_TestVisualEnable="false",
              dss_inifilepath = dir,
              dss_inifilename = "backtest.ini",
              dss_mode = "backtest")

```

---

x\_test\_model

*Table with a dataset to test the Model*

---

### Description

Table with a dataset to test the Model

### Usage

```
x_test_model
```

### Format

A dataframe with several columns

**LABEL** future price change

**X1-X75** Values of the macd indicator

---

y

*Table with indicators and price change which is used to train model*

---

**Description**

Table with indicators and price change which is used to train model

**Usage**

y

**Format**

A dataframe with several columns

**X1** Time index

**X2** Closed price now

**X3** Closed price 34 bars ago

**X4-X19** Series of Indicator values

**LABEL** Price difference, difference between X3 and X2
